

**TEST REPORT**  
**IEC 60825-1**  
**Safety of laser products -**  
**Part 1: Equipment classification and requirements**

**Report Number..... :** SHES230801506971

**Date of issue..... :** 2023-08-15

**Total number of pages ..... :** 15 Pages

**Name of Testing Laboratory preparing the Report ..... :** SGS-CSTC Standards Technical Services (Shanghai) Co., Ltd.

**Applicant's name ..... :** Hangzhou LuminWave Technology Co.,Ltd.

**Address..... :** Room 1203, Room 1203, Building B, 459 Jianghong Road, Binjiang District, Hangzhou, Zhejiang, CHINA, 310000

**Test specification:**

**Standard ..... :** IEC 60825-1:2014

**Test procedure ..... :** SGS-CSTC

**Non-standard test method ..... :** N/A

**TRF template used..... :** IECEE OD-2020-F1:2021, Ed.1.4

**Test Report Form No. .... :** IEC60825\_1G

**Test Report Form(s) Originator .... :** OVE

**Master TRF ..... :** Dated 2021-10-05

**Name and address of factory (ies).....** : Same as applicant

**General product information and other remarks:**

The product is a TOF Camera with 2 laser light source.

Laser source specification:

| Manufacturer/Trademark | Model reference | Characteristic/Spec |
|------------------------|-----------------|---------------------|
| Vertilite              | P35940S2K005    | 940nm; 3,5A; 4,8 V  |

Reasonably foreseeable single fault was considered by the client that it is impossible to emit a laser exceeds the normal operating mode nor become CW.

The product is classified to a **Class 1** laser product for both above conditions.

Following information should be on the manual:

- a) adequate instructions for assembly, maintenance and safe use and description of the classification limitations, if appropriate.
- b) additional warning for Class 1M and 2M
- c) laser beam parameters for radiation above the AEL of Class 1 (Wavelength; Beam divergence; Maximum power or energy output)
- d) safety instruction for embedded laser products and other incorporated laser products.
- e) MPE and NOHD for Class 3B and 4 laser products; For collimated beam Class 1M and 2M lasers the extended NOHD (ENOHD).
- f) information for the selection of eye protection.
- g) reproduction of all required labels and warnings.
- h) location of laser apertures
- i) list of controls, adjustments of procedures for operation and maintenance - and warning statement.
- j) information (compatibility requirements) about laser energy source if not incorporated.
- k) additional warning for Class 1, 1M, 2, 2M, and 3R regarding skin or corneal burns.

| 5.4.3 b | Angle of acceptance (for each condition).....  | Not limited  | P   |

| IEC 60825-1 |                    |                 |         |
|-------------|--------------------|-----------------|---------|
| Clause      | Requirement + Test | Result - Remark | Verdict |

Measured accessible laser radiation and comparison with AEL:

The measured peak wavelength is 940,5 nm.

Compared with condition 1, test result under condition 3 is stricter. Test performed on condition 3.

The product is a three nested pulsed laser:

|                          |         |
|--------------------------|---------|
| $T_{st}$                 | 104 ms  |
| Duty cycle <sub>st</sub> | 40,6%   |
| $T_{nd}$                 | 5,9 ms  |
| Duty cycle <sub>st</sub> | 44,4%   |
| $T_{rd}$                 | 50ns    |
| Duty cycle <sub>rd</sub> | 50%     |
| $t_{train 1}$            | 42,2 ms |
| $t_{train 2}$            | 2,6 ms  |
| Single pulse duration    | 25 ns   |
| Average duty cycle       | 9%      |

#### AELs for Class 1:

$\alpha=54$  mrad;  $\alpha_{max\_single}=5$  mrad;  $C_{6\_single}=3,333$ ;  $\alpha_{max\_T}=100$  mrad;  $C_{6\_T}=36$ ;  $C_4=3,027$ ;  $T_2=34,119$ ;  $T_i=5*10^{-6}$ ;  $N_{train1}=328$ ;  $N_{train2}=2347$ ;  $C_5=0,4$ ;  $C_{6\_train1}=27,398$ ;  $C_{6\_train2}=6,824$

$AEL_{single} = 7,7*10^{-8} C_4 C_6 J = 7,769*10^{-7} J$

$AEL_T = 7*10^{-4} C_4 C_6 T_2^{-0.25} W = 3,156*10^{-2} W$

$AEL_{s.p.train1} = AEL_{single\_train1} * C_5 = 7*10^{-4} t^{0.75} C_4 C_6 C_5 J = 2,163*10^{-3} J$

$AEL_{s.p.train2} = AEL_{single\_train2} * C_5 = 7*10^{-4} t^{0.75} C_4 C_6 C_5 J = 6,697*10^{-5} J$

Considered at 0 mm at 3,5mm diameter aperture: 500mW (AEL for class 3B)

#### Measurement:

Average power= $1,724*10^{-3} W$ ; single pulse power= $1,916*10^{-2} W$

Exposure from single pulse = $1,916*10^{-2} * 2,5*10^{-8} J = 4,789*10^{-10} J < AEL_{single}$

Average power for a pulse train =  $1,724*10^{-3} W < AEL_T$

Energy per pulse<sub>train1</sub> = $3,591*10^{-4} J$

Energy per pulse<sub>train2</sub> = $2,509*10^{-5} J$

Accessible emission for 3,5mm aperture at 0 mm = 47,6 mW < 500mW

Test data doesn't exceed the limits of Class 1.

Therefore, the product has been classified to **Class 1 laser product**.

|----------------------------|---|-----------------|---------|
| Clause                     | Requirement + Test  | Result - Remark | Verdict |
|                            | <p>“This Part 1 describes requirements that are considered sufficient to achieve the required level of product safety for general laser products with respect to hazards to the eye and skin posed by laser radiation, provided that consumer laser products comply with EN 506891 (see 9.5 in EN 60825-1:2014/FprAA:2020). Also, as required in 5.3 b) of EN 60825-1, that laser products classified as Class 1C comply with the respective applicable part of either the EN 60601 series or the EN 60335 series that contains requirements for the safe exposure of the skin (note that the exposure of the skin is not necessarily limited to the MPE values of the skin), if applicable, as well as specific requirements for the performance and testing of the safeguard that prevents hazardous emission towards the eye. Depending on the type of the product, laser products such as for example medical lasers, machines or toys can be required to conform to the applicable performance and testing requirements of their relevant product safety standards.</p> <p>NOTE 3 See 3.92 for “general laser product”.</p> <p>Where a laser system forms a part of equipment which is subject to another IEC product safety standard, e.g. for medical equipment (IEC 60601-2-22), IT equipment (IEC 60950 series), audio and video equipment (IEC 60065), audio-video and IT equipment (IEC 62368-1), electrical equipment for measurement, control, and laboratory use (IEC 61010-1), equipment for use in hazardous atmospheres (IEC 60079), or electric toys (IEC 62115), this Part 1 will apply in accordance with the provisions of IEC Guide 1042 for hazards resulting from laser radiation.”</p> |                 |         |
| <b>3</b>                   | <p><b>Terms and definitions</b></p> <p><i>In Clause 3, add the following terms and their definitions:</i></p>   |                 | P       |
| <b>3.9.1</b>               | <p><b>consumer laser product</b></p> <p>any product or assembly of components that:</p> <p>(a) is intended for consumers, or likely to be used by consumers under reasonably foreseeable conditions even if not intended for them; and</p> <p>(b) constitutes or incorporates a laser or laser system</p>   |                 | N/A     |
| <b>3.9.2</b>               | <p><b>general laser product</b></p> <p>laser product that does not fall within the scope of another EN standard that addresses the safety of a specific category of laser products</p> <p>Note 1 to entry: Examples of products where such other EN Standards exist are medical lasers (EN 60601-2-22), electric toys (EN 62115) or laser processing machines (EN ISO 11553-1, EN ISO 11553-2).</p> <p>Note 2 to entry: General laser products are for instance laboratory equipment, laser products for measurements, laser pointers, display lasers and laser illuminated projectors.</p> <p>Note 3 to entry: EN 506891 is not considered as another EN standard that addresses the safety of a specific category of laser products, since it applies to all consumer laser products.“</p>  |                 | P       |

| IEC60825_1G – ATTACHMENT 1 |   |                 |         |
|----------------------------|---|-----------------|---------|
| Clause                     | Requirement + Test  | Result - Remark | Verdict |
| 4.3                        | <p><b>Classification rules</b></p> <p><i>In Note 3 of 4.3 c), replace the following text:</i></p> <p>“NOTE 3 A source is considered an extended source when the angular subtense of the source is greater than <math>\alpha_{min}</math>, where <math>\alpha_{min} = 1,5</math> mrad. Most laser sources have an angular subtense <math>\alpha</math> less than <math>\alpha_{min}</math>, and appear as an apparent “point source” (small source) when viewed from within the beam (intra-beam viewing). Indeed a circular laser beam cannot be collimated to a divergence less than 1,5 mrad if it is an extended source, thus any laser where a beam divergence of 1,5 mrad or less is specified cannot be treated as an extended source. For a small source, <math>\alpha</math> is set to <math>\alpha_{min} = 1,5</math> mrad and <math>C6 = 1</math>.”</p> <p><i>with:</i></p> <p>“NOTE 3 An apparent source is considered an extended source when the angular subtense of the apparent source (i.e. the angular subtense of the image of the source) is greater than <math>\alpha_{min}</math>, where <math>\alpha_{min} = 1,5</math> mrad (note that different accommodation states as well as different positions in the beam have to be considered for the classification of extended sources). Most laser sources have an angular subtense <math>\alpha</math> less than <math>\alpha_{min}</math>, and appear as an apparent “point source” (small source) when viewed from within the beam (intra-beam viewing). Indeed, if a laser beam is to qualify as an extended source, it cannot be collimated to a divergence less than 1,5 mrad unless it is astigmatic (i.e. could be collimated in one dimension only) or scanning. Thus any non-scanning circularly symmetric laser beam, where a beam divergence of 1,5 mrad or less is specified, cannot be treated as an extended source, since accommodation to infinity for intrabeam viewing of such a source produces a retinal image that subtends an angle of less than 1,5 mrad. Also, more generally, any circular, non-scanning high quality Gaussian beam (TEM00) with a beam quality factor M2 equal or close to unity is associated to a small apparent source, as either the beam waist subtends an angular subtense smaller than 1,5 mrad or the divergence is smaller than 1,5 mrad. For a small source, <math>\alpha</math> is set to <math>\alpha_{min} = 1,5</math> mrad and <math>C6 = 1</math>. See also definitions 3.7, 3.10, 3.36, 3.42. A frequent mistake is to associate the beam diameter, or the beam profile, at the laser aperture with the apparent source; the laser aperture as such has no special distinctiveness that is related to the apparent source. Examples of designs that might constitute an extended source are: transmissions through a diffusor, transmissions through a diffractive optical element (DOE), partially coherent beams (i.e. beams with low beam quality and therefore higher values of the beam quality factor M2), scanned emission, fibres, and astigmatic beams (since the eye cannot accommodate to both waists at the same time). Measurements of the image of the apparent source are expected to be performed with sufficient accuracy, typically with a laser beam profiler CCD camera. As an alternative to characterizing the angular subtense of the apparent source (note that different accommodation states are expected to be considered, as well as different positions in the beam, see 5.4.3), <math>C6</math> can be set to unity (simplified evaluation, see 5.4.2).”</p> |                 | P       |

|----------------------------|---|-----------------|---------|
| Clause                     | Requirement + Test  | Result - Remark | Verdict |
| <b>ZB.2.4</b>              | <p><b>Subclause 4.3 f) 3); determination of <math>\alpha</math></b></p> <p>The parameter <math>a_{max}</math> is a function of emission duration, i.e. <math>a_{max}(t)</math>. For an analysis of pulsed emission and extended sources, <math>a_{max}(t)</math> limits both the value of <math>\alpha</math> for the determination of <math>C6(\alpha)</math> as well as the angle of acceptance <math>\gamma</math> for the determination of the accessible emission (see 4.3 c) and d) and subclause ZB.2.3 of this amendment). In this process, <math>a_{max}(t)</math> is determined for the same emission duration <math>t</math> that is used to determine <math>AEL(t)</math> (i.e. the pulse duration or the pulse group duration for 4.3 f) 3) and the averaging duration for 4.3 f) 2), respectively).</p> <p>However, the parameter <math>\alpha</math> is also used in 4.3 f) 3) in the criteria to determine which <math>C5</math> is applied to <math>AELs.p.train(t)</math>. For these criteria to determine <math>C5</math>, the parameter <math>\alpha</math> is not limited to <math>a_{max}(t)</math> in the same way as for the determination of <math>C6</math> according to 4.3 d).</p> <p>To determine <math>T2(\alpha)</math> and in the criteria of 4.3 f) 3) "For <math>\alpha \leq 5</math> mrad", "For <math>5</math> mrad <math>&lt; \alpha \leq a_{max}</math>", and, "For <math>\alpha &gt; a_{max}</math>", the quantity <math>\alpha</math> is equal to the "long-term" <math>\alpha</math>, i.e. equal to <math>\alpha</math> as determined for a time base of 0,25 s or equal to the value of <math>\alpha</math> of <math>T2(\alpha)</math>. In the determination of this "long-term" <math>\alpha</math> (applying the method specified in 4.3 d)), <math>a_{max} = 100</math> mrad. That is, for <math>T2</math> and these inequalities, <math>\alpha</math> is not limited to a value of <math>a_{max}(t)</math> smaller than 100 mrad, and is therefore the same as the value that applies for the determination of <math>C6</math> for the time base of 0,25 s or 100 s, as applicable.</p> <p>As is generally defined (see 4.3 d)) the arithmetic mean is applied to determine <math>\alpha</math>, i.e. it is not necessary that both dimensions satisfy the criterion "For <math>\alpha \leq 5</math> mrad" independently.</p> <p>For the criterion "Unless <math>\alpha &gt; 100</math> mrad", the angular subtense of the apparent source <math>\alpha</math> is not restricted by <math>a_{max}</math>. For non-uniform (oblong, rectangular, or linear) sources, the inequality needs to be satisfied by both angular dimensions of the source in order for <math>C5 = 1</math> to apply. The value of <math>\alpha</math> determined with <math>a_{max} = 100</math> mrad (i.e. the "long-term" <math>\alpha</math>) can also be used for this criterion, alternatively: in this case the criterion is written as "Unless <math>\alpha = 100</math> mrad", because for <math>\alpha</math> to become exactly equal to 100 mrad, when applying <math>a_{max} = 100</math> mrad, the image of the apparent source has to be larger than 100 mrad in both dimensions.</p> <p>Since the "long-term" <math>\alpha</math> is needed for the inequalities in 4.3 f) 3) to determine the applicable <math>C5</math>, the usual sequence is as follows.</p> <p>An analysis of the image of the apparent source is performed as given in 4.3 d) while either using <math>AEL(t = 0,25</math> s), or <math>AEL(t = T2(\alpha))</math>, depending on the time base. The angle of acceptance (as dimensions of the field of view) is varied between 1,5 mrad and 100 mrad in each dimension. Each field of view is associated to a certain value of <math>T2</math> and therefore <math>AEL(t = T2)</math>. The accessible emission is also determined for the respective field of view. The result of the process to vary the field of view is the "long-term" <math>\alpha</math> that is associated to the field of view that produces the maximum ratio of AE to AEL. For the case of classification as Class 1, this process to determine the "long-term" <math>\alpha</math> at the same time determines the value of <math>T2(\alpha)</math>. This "long-term" <math>\alpha</math> is used for <math>C6</math> for <math>AEL(t = 0,25</math> s), or <math>AEL(t = T2(\alpha))</math>, respectively, as well as the associated field of view to determine the AE for the comparison with these AEL.</p> <p>Following this step of the determination of the "long-term" <math>\alpha</math>, all applicable shorter emission durations have to be analysed. For the analysis of emission durations less than 0,25 s, the "long-term" <math>\alpha</math> is used to determine the appropriate <math>C5</math> in the equalities of 4.3 f) 3). <math>T2(\alpha)</math> is also relevant for the determination of <math>N</math> within <math>T2(\alpha)</math> or the time base, whichever is shorter.</p> |                 | P       |

| Clause                     | Requirement + Test  | Result - Remark | Verdict |
| <b>ZB.2.5</b>              | <p><b>Subclause 4.3 f) 3); groups of pulses with group duration longer than <math>T_1</math></b></p> <p>For non-uniform repetitive pulse patterns, i.e. groups of pulses (see Figure ZB.2 for an example), when <math>\alpha &gt; 5</math> mrad and the duration of the group of pulses is longer than <math>T_1</math>, it is not clearly stated how the thermal additivity expressed by requirement 3) of 4.3 f) is applied. For <i>uniform</i> (i.e. constant peak power, duration and period) repetitive pulse trains, it is not necessary to analyse the emission patterns in terms of groupings of pulses.</p> <p>When individual pulses are close together, they are thermally grouped and thermally represent one “effective” pulse so that C5 also (additionally to analysing the pulse train based on the actual pulses and the average power) applies to these “effective” pulses, where <math>N</math> is the number of pulse groups within <math>T_2</math> or within the time base, whichever is shorter.</p>  <p><b>Figure ZB.2 — Example of three groups of pulses (each group duration is longer than <math>T_1</math>) where each group is considered as one “effective” pulse and C5 is applied to the AEL that applies to the group duration, where C5 is determined with the number of pulse groups within the evaluation duration (in the example of the figure <math>N = 3</math>)</b></p> |                 | P       |
|                            | <p>For the analysis of pulse groups, the value of AEL<sub>single</sub> is determined for the corresponding pulse group duration <math>t_{group}</math>. For the determination of C5, <math>N</math> is the number of pulse groups within <math>T_2</math> or the time base, whichever is shorter. The respective value of C5 is applied to AEL<sub>single</sub> to obtain AEL<sub>s.p.train</sub> that limits the AE of the pulse groups, where AE is the sum of the energy of the pulses contained within the pulse group.</p>   |                 | P       |

| IEC60825_1G – ATTACHMENT 1 |  |                 |         |
|----------------------------|--|-----------------|---------|
| Clause                     | Requirement + Test   | Result - Remark | Verdict |
|                            | <p>For the application of C5 to groups of pulses, the AEL(<math>t_{group}</math>) applicable to the group needs to be determined, as well as the energy per group (AE<math>_{group}</math>).</p> <p>For groups of pulses where the peak power of the pulses within the group varies, the group duration is not well defined. In order to simplify the evaluation, <math>t_{group}</math> can be set equal to the integration duration for which the energy per group (i.e. AE<math>_{group}</math>) was determined; it is not necessary to determine the group duration based on the FWHM criterion, which for groups of pulses with varying peak power is not well defined. By setting <math>t_{group}</math> equal to the integration duration that is used to determine AE<math>_{group}</math> (expressed as energy), the application of C5 to groups of pulses is a simple extension of requirement 2) of 4.3. f) where the average power per group (equal to the energy within the averaging duration <math>t_{average}</math> divided by the averaging duration) needs to be below the AEL(<math>t_{average}</math>) determined for the duration over which the power was averaged (AE<math>_{group}</math> and AEL(<math>t_{group}</math>) expressed as power). As is common for the average power requirement, for irregular pulse trains, the averaging duration window (when expressed as energy: the integration duration window) has to be varied in temporal position and duration (for instance, if there are pulses with relatively low energy per pulse at the beginning or the end of the group of pulses, integration durations that exclude those low-energy pulses need to be considered also, not only the total group).</p> |                 | P       |

|----------------------------|--|-----------------|---------|
| Clause                     | Requirement + Test   | Result - Remark | Verdict |
|                            | <p>If individual pulses have sufficient temporal spacing (period larger than <math>T_{crit}</math>, see below), as a simplified analysis, they need not be considered for an analysis as a pulse group under 4.3 f) 3). The temporal spacing that is necessary for pulses to only be considered separate (and not analysed additionally as a group) depends on the angular subtense of the apparent source and the duration of the pulses <math>t_{pulse}</math> within the group. Note that there can be several levels of grouping, so that individual elements (with pulse duration <math>t</math>) within the group could themselves be “effective pulses”, i.e. subgroups.</p> <p>When the</p> <ul style="list-style-type: none"> <li>— pulse group durations (<math>t_{group}</math>) are between <math>T_i</math> and 0,25 s, and</li> <li>— the angular subtense of the apparent source is larger than 5 mrad, and</li> <li>— the period of the pulses (see Figure ZB.2) is shorter than a critical period <math>T_{crit}</math> (if <math>t_{pulse} &lt; T_i</math>, the value of <math>t_{pulse}</math> is set equal to <math>T_i</math>; further, for the determination of <math>T_{crit}</math>, <math>\alpha_{max}</math> is determined for <math>t_{pulse}</math>, not the group duration) where:</li> </ul> <p>for <math>\alpha \leq \alpha_{max}</math>: <math>T_{crit} = 2 \cdot t_{pulse}</math> where <math>t_{pulse}</math> is in seconds<br/> for <math>\alpha &gt; \alpha_{max}</math>: <math>T_{crit} = 0,01 \alpha \cdot t_{pulse} 0,5</math> where <math>t_{pulse}</math> is in seconds, and <math>\alpha</math> is in mrad, not being limited to <math>\alpha_{max}</math></p> <p>then these pulses constitute a pulse group which is treated as effective pulses and <math>C_5</math> (where <math>N</math> is the number of groups within the time base or <math>T_2</math>, whichever is shorter) is applied to the AEL applicable to the pulse group. For the determination of AE, <math>\alpha_{max}</math> is determined using the duration of the evaluated pulse group, <math>t_{group}</math>. If one or more of the above conditions are not fulfilled, then the pulses within the group of pulses that is considered to be analysed as “effective pulse” need not be grouped, i.e. the group of pulses does not need to be analysed as one “effective” pulse.</p> <p>Note that if multiple pulses occur within <math>T_i</math>, the rule as stated in 4.3 f) 3) applies in parallel, i.e. they are counted as a single pulse to determine <math>N</math> and the energies of the individual pulses that occur within <math>T_i</math> are added to be compared to the AELs.p.train of <math>T_i</math> where the corresponding <math>C_5</math> for emission durations <math>t \leq T_i</math> is applied.</p> |                 | P       |
| <b>ZB.2.6</b>              | <b>Subclause 4.3 f); simplifications</b>   |                 | N/A     |
|                            | <p>a) Constant peak power but shorter pulses<br/> Depending on the angular subtense of the apparent source, it can be the case that the value of <math>C_5</math> is more restrictive for pulses with pulse durations less than <math>T_i</math> than for pulses with durations longer than <math>T_i</math> which is against general biophysical principles for cases where the peak power is the same.</p>   |                 | N/A     |
|                            | <p>b) Larger image of apparent source<br/> For emission durations exceeding <math>T_i</math>, due to the step-function of <math>C_5</math> at 5 mrad and at <math>\alpha_{max}</math>, the AEL (as a function of <math>C_5</math> and <math>C_6</math>) can be more restrictive for larger values of the angular subtense of the apparent source as compared to smaller ones, which is contrary to general biophysical principles.</p>   |                 | N/A     |

|                            | <p>c) Using a square aperture stop</p> <p>In some cases, such as 2D scanned laser beams, the use of a circular aperture stop to determine the accessible emission creates very complex pulse patterns. Due to the breakpoints in terms of pulse duration with step functions in the value of <math>C5</math>, it might not be apparent that the usage of a square aperture is acceptable as a simplified worst case analysis.</p>   |                 | N/A     |
|                            | <p>d) Applicability of simplified default analysis</p> <p>For pulse durations longer than <math>T_i</math>, the value of <math>C5</math> is smaller (more restrictive) for angular subtense values <math>\alpha</math> larger than 5 mrad compared to <math>\alpha \leq 5</math> mrad. The assumption of <math>\alpha = 1,5</math> mrad is the basis of the simplified (default) evaluation. It is therefore not obvious if the simplified (default) analysis still applies in terms of being a restrictive simplifying analysis even for the case that the angular subtense of the apparent source is actually larger than 5 mrad, where <math>C5 &lt; 1</math>.</p>   |                 | N/A     |
|                            | <p>e) Determination of the most restrictive position</p> <p>For the extended analysis, it is necessary to vary the distance relative to the reference point to determine the most restrictive position. For each position in the beam, the accommodation is varied and the most restrictive image is determined. For determining the most restrictive image (where the ratio <math>AE/AEL</math> is maximum) at a given position, requirement 3) of 4.3 f) is not applied. Otherwise a blurred (larger) image of the apparent source, resulting from variation of the accommodation, could appear more restrictive, which is contrary to general biophysical principles. Once the most restrictive image (and associated <math>\alpha</math>) is identified for each position in the beam, all three requirements of 4.3 f) are applied to determine the most restrictive position (identifying the position with the maximum ratio of <math>AE/AEL</math>) and the class of the product.</p> |                 | N/A     |

|                            | <p>f) Application of the total-on-time-pulse method; For regular pulse trains, as well as for varying pulse durations and/or varying period of pulses (but excluding strongly varying peak powers; see below), the total-on-time pulse (TOTP) method (see also IEC 60825-1 Edition 2.0 subclause 8.3 f) 3b)) may be used as an alternative to requirement 3) of 4.3 f), i.e. as an alternative to the application of C5 to the single pulse AEL, provided that <math>a_{max}</math> is determined for the TOTP (or using the worst case value of 100 mrad). This is more restrictive than the rules of 4.3 f) because it is equivalent to an unlimited C5 (C5 not limited to 0,2 or 0,4), and because the value of <math>a_{max}</math> is typically larger for the TOTP as compared to the value applicable to the single pulse.</p> <p>For the total-on-time-pulse (TOTP) method the following applies, as reproduced from Edition 2 of IEC 60825-1:</p> <p>The AEL is determined by the value of the TOTP, which is the sum of all pulse durations within the emission duration or <math>T_2</math>, whichever is smaller. Pulses with durations shorter than <math>T_i</math> are assigned pulse durations of <math>T_i</math>. If two or more pulses occur within a duration of <math>T_i</math> these pulse groups are assigned pulse durations of <math>T_i</math>. For comparison with the AEL for the corresponding duration, all individual pulse energies are added.</p> <p>Note that the TOTP method in Edition 2 of IEC 60825-1 (incl. Corrigendum 1) was specified "For varying pulse widths or varying pulse intervals" and did not refer to varying peak powers. For the case of strongly varying peak powers, the TOTP method is not applicable, as adding pulses to the pulse train with small peak powers and low contributing energy-per-pulse values might increase the AEL (by increasing the total-on-time) more than this increases the total energy, and thus would make the emission less critical as compared to an emission based on the pulses with the large peak power only.</p> |                 | N/A     |

|                            | <p>g) Varying peak power but constant pulse duration</p> <p>For varying peak power but constant pulse durations, requirement 3) of 4.3 f) can be applied by counting the pulses for the determination of <math>N</math> based on the relative peak power, i.e. <math>N</math> is increased by 1,0 for each pulse with the maximum peak power, and by a value of less than 1,0 for pulses with lower peak power, such as for a pulse with 70 % peak power compared to the maximum peak power in the pulse train, <math>N</math> is increased by 0,7. For this, based on the strong nonlinearity of thermally induced injury with temperature, it is justified not to count pulses with peak powers that are more than a factor of 10 below the pulse with the maximum peak power (i.e. less than 10 % of the maximum peak power). Note that the resulting AELs.p.train is applied to the pulse with the largest AE, i.e. the largest energy per pulse, and that the interpretation in this paragraph applies only for the case of pulse trains with constant pulse durations.</p> |                 | N/A     |
